

Precision Operational Amplifier, 25 μV Offset, Zero-Drift, 36 V Supply, 2 MHz

ON Semiconductor®

www.onsemi.com

NCS21911, NCV21911, NCS21912, NCV21912, NCS21914, NCV21914

The NCS2191x family of high precision op amps feature low input offset voltage and near-zero drift over time and temperature. These op amps operate over a wide supply range from 4 V to 36 V with low quiescent current. The rail-to-rail output swings within 10 mV of the rails. The family includes the single channel NCS(V)21911, the dual channel NCS(V)21912, and the quad channel NCS(V)21914 in a variety of packages. All versions are specified for operation from -40°C to $+125^{\circ}\text{C}$. Automotive qualified options are available under the NCV prefix.

Features

- Input Offset Voltage: $\pm 25 \mu\text{V}$ max
- Zero-Drift Offset Voltage: $\pm 0.085 \mu\text{V}/^{\circ}\text{C}$ max
- Voltage Noise Density: 22 nV/ $\sqrt{\text{Hz}}$ typical
- Unity Gain Bandwidth: 2 MHz typical
- Supply Voltage: 4 V to 36 V
- Quiescent Current: 570 μA max
- Rail-to-Rail Output
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-free, Halogen free/BFR free and are RoHS compliant

Typical Applications

- Temperature Measurements
- Transducer Applications
- Electronic Scales
- Medical Instrumentation
- Current Sensing
- Automotive

ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Unit
Supply Voltage (VDD– VSS)	40	V

INPUT AND OUTPUT PINS

Input Voltage (Note 1)	VSS – 0.3 to VDD + 0.3	V
Differential Input Voltage (Note 2)	±17	V
Input Current (Notes 1 and 2)	±10	mA
Output Short Circuit Current (Note 3)	Continuous	mA

TEMPERATURE

Operating Temperature	–40 to +125	°C
Storage Temperature	–65 to +150	°C
Junction Temperature	+150	°C

ESD RATINGS (Note 4)

Human Body Model (HBM)	3000	V
Charged Device Model (CDM)	2000	V

OTHER RATINGS

Latch–up Current (Note 5)	100	mA
MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Input terminals are diode–clamped to the power–supply rails. Input signals that can swing more than 0.3 V beyond the supply rails should be current limited to 10 mA or less.
- The inputs are diode connected with a total input protection of 1.65 kΩ, increasing the absolute maximum differential voltage to ±17 V_{DC}. If the applied differential voltage is expected to exceed this rating, external resistors should be added in series with the inputs to limit the input current to ±10 mA.
- Short–circuit to V_{DD} or V_{SS}. Short circuits to either rail can cause an increase in the junction temperature. The total power dissipation must be limited to prevent the junction temperature from exceeding the 150°C limit.
- This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per JEDEC standard JS–001–2017 (AEC–Q100–002)
ESD Charged Device Model tested per JEDEC standard JS–002–2014 (AEC–Q100–011)
- Latch–up Current tested per JEDEC standard JESD78E (AEC–Q100–004).

THERMAL INFORMATION (Note 6)

Rating	Symbol	Package	Value	Unit

APPLICATION INFORMATION

Overview

The NCS21911, NCS21912, and NCS21914 precision op amps provide low offset voltage and zero drift over temperature. With a maximum offset voltage of 25 μV and input common mode voltage range that includes ground, the NCS21911 series is well-suited for applications where precision is required, such as low side current sensing and interfacing with sensors.

The NCS21911 series of amplifiers uses a chopper-stabilized architecture, which provides the advantage of minimizing offset voltage drift over temperature and time. The simplified block diagram is shown in Figure 41. Unlike the classical chopper architecture, the chopper stabilized architecture has two signal paths.

Figure 41. Simplified NCS21911 Block Diagram

In Figure 41, the lower signal path is where the chopper samples the input offset voltage, which is then used to correct the offset at the output. The offset correction occurs at a frequency of 250 kHz. The chopper-stabilized architecture is optimized for best performance at frequencies up to the related Nyquist frequency (1/2 of the offset correction frequency). As the signal frequency exceeds the Nyquist frequency, 125 kHz, aliasing may occur at the output. This is an inherent limitation of all chopper and chopper-stabilized architectures. Nevertheless, the NCS21911 series op amps have minimal aliasing up to 200 kHz and are less susceptible to aliasing effects when compared to competitor parts from other manufacturers. ON Semiconductor’s patented approach utilizes two cascaded, symmetrical, RC notch filters tuned to the chopper frequency and its fifth harmonic to reduce aliasing effects.

The chopper-stabilized architecture also benefits from the feed-forward path, which is shown as the upper signal path of the block diagram in Figure 41. This is the high speed signal path that extends the gain bandwidth up to 2 MHz. Not

only does this help retain high frequency components of the input signal, but it also improves the loop gain at low frequencies. This is especially useful for low-side current sensing and sensor interface applications where the signal is low frequency and the differential voltage is relatively small.

Application Circuits

Low-Side Current Sensing

Low-side current sensing is used to monitor the current through a load. This method can be used to detect over-current conditions and is often used in feedback control, as shown in Figure 42. A sense resistor is placed in series with the load to ground. Typically, the value of the sense resistor is less than 100 m Ω to reduce power loss across the resistor. The op amp amplifies the voltage drop across the sense resistor with a gain set by external resistors R1, R2, R3, and R4 (where R1 = R2, R3 = R4). Precision resistors are required for high accuracy, and the gain is set to utilize the full scale of the ADC for the highest resolution.

Figure 42. Low-Side Current Sensing

Differential Amplifier for Bridged Circuits

Sensors to measure strain, pressure, and temperature are often configured in a Wheatstone bridge circuit as shown in Figure 43. In the measurement, the voltage change that is

produced is relatively small and needs to be amplified before going into an ADC. Precision amplifiers are recommended in these types of applications due to their high gain, low noise, and low offset voltage.

Figure 43. Wheatstone Bridge Circuit Amplification

EMI Susceptibility and Input Filtering

Op amps have varying amounts of EMI susceptibility. Semiconductor junctions can pick up and rectify EMI signals, creating an EMI-induced voltage offset at the output, adding another component to the total error. Input pins are the most sensitive to EMI. The NCS2191x integrates low-pass filters to decrease its sensitivity to EMI. Figure 39 shows the EMIRR performance.

capacitors as close as possible to the supply pins. Keep traces short, utilize a ground plane, choose surface-mount components, and place components as close as possible to the device pins. These techniques will reduce susceptibility to electromagnetic interference (EMI). Thermoelectric effects can create an additional temperature dependent offset voltage at the input pins. To reduce these effects, use metals with low thermoelectric coefficients and prevent temperature gradients from heat sources or cooling fans.

General Layout Guidelines

To ensure optimum device performance, it is important to follow good PCB design practices. Place 0.1 μ F decoupling

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 2009.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION *b* DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.10 mm IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSIONS *D* AND *E* DO NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 mm PER SIDE. DIMENSION *E* DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25 mm PER SIDE. DIMENSIONS *D* AND *E* ARE DETERMINED AT DATUM *F*.
5. DATUMS *A* AND *B* ARE TO BE DETERMINED AT DATUM *F*.
6. *A1* IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.
