# Silicon Carbide (SiC) Cascode JFET – EliteSiC, Power N-Channel, TO247-3, 650 V, 80 mohm

#### **UF3C065080K3S**

#### Description

This SiC FET device is based on a unique 'cascode' circuit configuration, in which a normally-on SiC JFET is co-packaged with a Si MOSFET to produce a normally-off SiC FET device. The device's standard gate-drive characteristics allows for a true "drop-in replacement" to Si IGBTs, Si FETs, SiC MOSFETs or Si superjunction devices. Available in the TO247-3 package, this device exhibits ultra-low gate charge and exceptional reverse recovery characteristics, making it ideal for switching inductive loads when used with recommended RC-snubbers, and any application requiring standard gate drive.

#### **Features**

- $\bullet~$  Typical On-resistance  $R_{DS(on),typ}$  of 80  $m\Omega$
- Maximum Operating Temperature of 175 °C
- Excellent Reverse Recovery
- Low Gate Charge
- Low Intrinsic Capacitance
- ESD Protected, HBM Class 2
- Very Low Switching Losses (Required RC-snubber Loss Negligible under Typical Operating Conditions)

1

• This Device is Pb-Free, Halogen Free and is RoHS Compliant

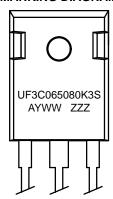

#### **Typical Applications**

- EV Charging
- PV Inverters
- Switch Mode Power Supplies
- Power Factor Correction Modules
- Motor Drives
- Induction Heating

#### **APPLICATIONS INFORMATION**

SiC FETs are enhancement-mode power switches formed by a highvoltage SiC depletion-mode JFET and a low-voltage silicon MOSFET connected in series. The silicon MOSFET serves as the control unit while the SiC JFET provides high voltage blocking in the off state. This combination of devices in a single package provides compatibility with standard gate drivers and offers superior performance in terms of low on-resistance ( $R_{DS(on)}$ ), output capacitance ( $C_{oss}$ ), gate charge ( $Q_G$ ), and reverse recovery charge ( $Q_{T}$ ) leading to low conduction and switching losses.

The SiC FETs also provide excellent reverse conduction capability eliminating the need for an external anti-parallel diode

Like other high performance power switches, proper PCB layout design to minimize circuit parasitics is strongly recommended due to the high dv/dt and di/dt rates. An external gate resistor is recommended when the cascode is working in the diode mode in order to achieve the optimum reverse recovery performance.
